Another chrome film is formed on the counter substrate 12, followed by patterning thereof to form the black matrix 19 for covering substantially all over the area other than the pixel area. A color filter 20 is formed thereon using the three photolithographic steps for a polyimide based layer, made by dispersing R-G-B pigments in a photosensitive polymer. The overcoat layer 22 is then form by spin-coating and subsequent patterning of polyimide. The overcoat layer 22 prevents impurity ions eluted from the color filter 20 from being mixed into the LC layer 18. The overcoat layer 22 also functions for flattening the surface of the counter
